EXPERIENCE

Development Team Leader

Feb. 2023 – Aug. 2026

Google Developer Groups

Ghardaia, Algeria

- Led 8 developers across 5+ community technology projects and workshops, coordinating delivery from requirements through deployment.
- Collaborated with 4 cross-functional teams to ship 3 open-source projects using **React**, **Next.js**, **FastAPI**, and **Node.js**.
- Mentored 10+ junior developers in **TypeScript**, Git workflows, testing with **Jest**, and **GitHub Actions** CI/CD.

Software Engineer and Mentor

Jan. 2024 – Oct. 2024

Erenov

Ghardaia, Algeria

- Taught 30 students the foundations of web development through lessons and practical projects using **HTML**, **CSS**, **JavaScript**, and **PHP**.
- Designed a QR-code scanning system in **Python** to support event and registration workflows.
- Deployed a student registration system with **Docker** and **AWS**, packaging the application for a repeatable hosted setup.

TECHNICAL SKILLS

- **Languages:** Python, TypeScript, Java
- **Frameworks & Libraries:** React, Next.js, FastAPI, Django, Express, Selenium
- **Data Management:** MongoDB, PostgreSQL, SQLite, Redis
- **Tools:** Docker, AWS, GitHub Actions, Firebase

PROJECTS

4 Player Checkers | *Real-Time Multiplayer Web Game*

- Built a real-time multiplayer game for 4 concurrent users with a **React** + **TypeScript** client and **Node.js** + **Express** server using **Socket.io**.
- Shared a deterministic rules engine and types between client and server so the authoritative server re-validates optimistic moves and resynchronizes mismatches.
- Implemented room lifecycle state, mandatory captures, multi-jumps, authoritative clocks, forfeits, and token-based reconnection for reliable cross-client play.
- Dockerized development with **Docker Compose** and configured **GitHub Actions** deployment to GitHub Pages and **Azure**; tested complete lifecycles with four concurrent browser clients using **Selenium**.

Steam Shelf | *Python Automation and Steam Library Tool*

- Automated imports for 30+ games into Steam by combining executable discovery, metadata matching, and binary VDF serialization in **Python**, reducing a manual workflow to a repeatable process.
- Reduced lookup latency by 10x+ by caching Steam metadata in **SQLite** and reusing local app data instead of calling the API per game.
- Built a multi-threaded artwork pipeline with CDN fallback and separate CLI/GUI interfaces, keeping large-library imports responsive during scanning and downloads.
- Reverse engineered Steam's undocumented **shortcuts.vdf** format and implemented read/write serialization with unit and integration coverage for full import flows.

Secret Message | *MERN Full-Stack Anonymous Messaging App*

- Developed a **React 19** + **TypeScript** frontend and modular **Node.js/Express** REST API backed by **MongoDB** and **Mongoose**.
- Implemented 15-minute access tokens with 15-day refresh tokens in an **httpOnly** cookie, including silent interceptor-based refresh and protected routes.
- Validated input with **Zod**, hashed passwords with **Argon2**, sanitized message content, and restricted credentialed CORS to known origins.

EDUCATION

University of Ghardaia

B.S. in Mathematics and Computer Science (Computer Systems)

Ghardaia, Algeria

Sep. 2023 – June 2026; Valedictorian
